Ambient Noise Tomography fundamentals

Christoph Sens-Schönfelder

GFZ German Research Centre for Geosciences, Potsdam, Germany

4DMB meeting, 2.2.2018

Recap

tomographic techniques:

- refraction tomography
- local or teleseismic earthquake tomography
- surface wave tomography

common approach

Infer information about the medium from the observable interaction of a wavefied during the propagation from its **source** to a set of **receivers**.

Seismic records

(ロ) (回) (目) (目) (日) (の)

Seismic records

Signals from impulsive localized sources make up a tiny fraction of the records only. Most of it is NOISE.

One can create data for tomography from random fields by correlating records from different locations!

Green's functions extraction:

$$G(\mathbf{x}_B, \mathbf{x}_A, t) + G(\mathbf{x}_B, \mathbf{x}_A, -t) \propto \int_{S} G(\mathbf{x}_B, \mathbf{x}, t) + G(\mathbf{x}_A, \mathbf{x}, -t) dS$$

Application 3: noise correlation

GEMEINSCHAFT

First summary

Seismic interferometry

- uses records of a random wavefield that contains the required waves
- waves propagating between receivers are extracted from the random field by cross correlation
- allows to retrieve surface waves traveling between seismic stations

Some review papers on SI:

- [Snieder, 2004]
- [Campillo, 2006]
- [Curtis et al., 2006]

hum and primary microseisms around 12 s period: interference of waves with ocean bottom topography

seismic waves excited by the action of ocean waves

- hum and primary microseisms around 12 s period: interference of waves with ocean bottom topography
- secondary (double frequency) microseism around 6 s period: wave-wave interaction

イロト イポト イヨト イヨト

seismic waves excited by the action of ocean waves

- hum and primary microseisms around 12 s period: interference of waves with ocean bottom topography
- secondary (double frequency) microseism around 6 s period: wave-wave interaction

The source site effect due to the water depth modulates the efficiency of seismic wave generation.

Seismic sources are neither simply below wind systems nor at the shore!

◆□> ◆□> ◆三> ◆三> ●三 のへの

Source regions of secondary microseisms

🚛 👝 [Landès et al., 2010]

Consequences for tomography

► source distribution is variable ⇒ potenial for estimates of wave velocities

[Froment et al., 2010]

 \Rightarrow long time averaging required to reduce the effect of non-uniform source distributions.

Summary

- seismic interferometry allows to retrieve the Green's function from random seismic fields (e.g. ambient noise)
- the ambient field below 0.3 Hz is generated in the oceans (microseisms)
- high frequency cultural noise above 1 Hz
- $\Rightarrow\,$ allows for surface wave tomography without individually identified sources
 - uneven source distribution can bias velocity estimates
